

Environmental Impact

R4 is following the strategies below to bring down our carbon footprint:

1. Use energy more efficiently. Producing electricity and natural gas and delivering it to your door generates greenhouse gas emissions. R4 installed energy-efficient building systems and equipment to save energy and reduce our environmental footprint.
2. Conserve water. Energy is used (and emissions generated) to heat the water used in your facility and process wastewater. Reduce water heater temperatures and repair leaks. R4 has installed low-flow plumbing fixtures and aerated faucets to reduce the amount of water used.
3. Reduce, reuse, recycle. R4 has an established recycling program. R4 looks for ways to use less. R4 has a preventive maintenance program to make equipment last longer.
4. Travel less. Employees driving to and from work produce a substantial amount of air pollution. R4 encourages employees to use public transportation or organize carpools and allow employees to work from home whenever possible. R4 minimizes business travel through web conferencing, email, and other low-emission communications.
5. Consider near sourcing. All businesses require resources to function, whether it is office supplies or raw materials for manufacturing. Transporting these resources to your door uses energy and creates emissions. R4 uses local vendors to reduce our environmental impact.
